| Expression System        | HEK293 Cells                                                                                                                                                                                                                                                |
| Reinheit                 | > 95 % as determined by reducing SDS-PAGE.                                                                                                                                                                                                                  |
| Formulierung             | Lyophilized from a 0.2 um filtered solution of 20mM PB, 150mM NaCl, pH 7.2. Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween80 are added as protectants before lyophilization. Please refer to the specific buffer information in the printed manual. |
| Sequenz                  | Ile17-Asn314                                                                                                                                                                                                                                                |
| Target-Kategorie         | Osteopontin,SPP1                                                                                                                                                                                                                                            |
